

ABSTRACT

Augmenting Sets of Image Recordings

- 5 A method is provided for augmenting a set of image recordings in which, in addition to making image recordings (95), location data (175) is recorded for locations for which the user desires an, or a further, image recording. This desired-image-recording location data is subsequently used to retrieve one or more corresponding image recordings from a service system (40).

(Fig. 17)

FIG. 17 is a block diagram of a system for augmenting sets of image recordings. The system includes a user device (100) and a service system (40). The user device (100) includes a camera (110) and a location sensor (120). The camera (110) is configured to capture image recordings (95). The location sensor (120) is configured to record location data (175) for locations for which the user desires an, or a further, image recording. The service system (40) includes a database (130) and a retrieval module (140). The database (130) stores image recordings (95) and location data (175). The retrieval module (140) is configured to retrieve one or more corresponding image recordings from the database (130) based on the location data (175).
